# Cloud Management System

Cloud features

- ❑ A cloud access can be accessed from any type of device, including mobile devices.

- ❑ Manage multiple Guest Internet gateways remotely from one location.

- ❑ Group gateways for easy management; ideal for managed service providers or for hotel chain IT depts.

- ❑ Access codes are generated for groups, and any gateway included in that group can authenticate the access code.

- ❑ Access codes can be generated with many parameters and various formats, including voucher printing in a 4x4 format.

- ❑ Each gateway polls the cloud so no local port forward configuration is required, simplifying the physical network installation.

- ❑ The Cloud monitors the data traffic through network circuits to identify bottlenecks.

- ❑ The Cloud is a free service available to all Guest Internet customers.

The Guest Internet cloud management system is a free service provided for all customers. The Cloud adds many features to the operation of Guest Internet products, which include:

- • Remote management

- • Management of many products

- • Management of products in groups

- • Management of a cellular network with roaming

The Guest Internet Cloud service adds functionality beyond what can be incorporated into a single gateway unit. The cloud empowers businesses to manage a large public access network from one location. This might be a hotel chain with thousands of properties, with a Guest Internet gateway installed at each property, or it might be a mobile broadband business managing a cellular WiFi network covering a city where the cloud manages the handoff process of a customer from one wireless antenna to the next to ensure that the user does not loose the Internet connection.

The Guest Internet customer base includes many network design, installation and service providers who use the free Cloud service to sell a managed service to their customers. Their customer segments include, hotels, motels, resorts, RV parks and campgrounds. Any business that is multi-site and offers an Internet service to the public will benefit by using the Guest Internet Cloud service.
